

Replication package for Olmstead and Sigman, “Droughts and Economic Activity”

Three directories:

1. Code: code, log files, and main analysis data sets
2. Data: data that was processed in GIS before being read into Stata
3. Output: figures and tables generated by the code

Processed data in “data” subdirectory:

1. Files from "Polygon to Raster" then “Raster to ASCII” in ArcGIS:
 - (a) pfaf4_id.asc: based on Hydro1k shapefiles
 - (b) admin1.asc: based on GADM geopackage files
2. Attribute tables following “spatial union” in ArcGIS of GRanD locations with areas:
 - (a) grand_pfaf4_global.txt: union with Hydro1k shapefile using Pfafstetter level 4 subbasin (=”pfaf4” below) areas
 - (b) dam_admin1_join.csv: union with GADM geopackage using Administrative Level 1 areas
3. pfaf4char_global.txt: exported attribute table from Hydro1k shapefile
4. pop2000_pfaf4.txt: from ArcMap, summary of Gridded Population of World pop density within pfaf4 subbasin areas
5. pfaf4_country_match.txt: attribute table for spatial union of Hydro1k shapefile with country boundary shapefile
6. /level4_down_basins/ and /level4_up_basins/: Continent-level upstream and downstream subbasins from MS-Basic code that read Pfafstetter coding from Hydro1k

Main analysis data sets in “code” directory:

1. for_reg.dta: main analysis data set for all grid-cell level analyses
2. for_reg_pfaf4.dta: alternative data for subbasin-level analyses in Appendix I
3. for_reg_admin1.dta: alternative data for state/province-level analyses in Appendix J

Code to create the main analysis datasets:

1. **read_lights.R** (runtime: 3,850 sec): read .tif files from NOAA website, aggregate to .05 degrees, and save as ASCII (run before read_lights_drought.do)
2. **read_DSI.R** (runtime: 978 sec): read .hdf files from UMontana website, save as ASCII (run before read_lights_drought.do)
3. **read_lights_drought.do** (runtime: 3,907 sec): read annual lights and DSI ASCII grids into Stata
4. **read_ascii_cru.do** (runtime: 488 sec): read sc-PSDI, temperature, and precipitation data from Climate Research Unit (CRU) website. Monthly .5 degree aggregated to annual.
5. **read_cropland.R** (runtime: 2 sec): read .tif file and output ascii. (run before read_other_raster.do)
6. **read_other_rasters.do** (runtime: 858 sec): read cross-sectional raster data (pfaf4, cropland, irrigation)
7. **read_pfaf4char.do** (runtime: 6 sec): read in and create subbasin level characteristics, including dams and upstream/downstream characteristics
8. **merge_grid.do** (runtime: 181 sec): combine all data and create for_reg.do, the main analysis dataset at the .5 degree grid-cell level
9. **merge_pfaf4.do** (runtime: 71 sec): creates alternative aggregation to Pfafstetter Level 4 subbasin level, used in Appendix I
10. **merge_admin1.do** (runtime: 268 sec): creates alternative aggregation to GADM Administrative Level 1, used in Appendix J

Stata analysis code:

(All start from main analysis dataset for_reg.dta, except reg_nocell.do)

1. **reg_main.do** (runtime: 678 sec): analysis for all tables (except Table 1) in the paper, Figure 1, and appendix tables C and D
2. **reg_mfx.do** (runtime: 70 sec): translate effects into elasticities and GDP changes for Table 1 in paper and Appendix F
3. **reg_appendix.do** (runtime: 333 sec): additional appendix tables and figures, including those in Appendices A, B, E, G, H, K, and L
4. **reg_nocell.do** (runtime: 9 sec): results with alternative aggregation levels (pfaf4 and admin1) in Appendices I and J (uses for_reg_pfaf4.dta and for_reg_admin1.dta)

Notes on running code:

- Stata code was run in Stata Now Version 19 and R code in R version 4.4.3.

- Directory addresses are relative to “code” directory. “cd” to code directory before running.
- Run all “read_xx” code before “merge_xx” code
- Additional Stata package “ras2dta” needed for reading in ASCII grid files
